                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NITSOLITEMENT Gene Collection (MGC) project;
Submitted (NOV-2004) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.
-!- CATALTIC ACTIVITY: ATP + nucleoside diphosphate = ADP +

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- COFACTOR: Magnesium (By similarity).

"Characterization and cloning of a nucleoside-diphosphate kinase
targeted to matrix of mitochondria in pigeon.";
J. Biol. Chem. 272:24604-24611(1997).
-! FINCTION: Major role in the synthesis of nucleoside triphosphates
other than ATP. The ATP gamma phosphate is transferred to the NDP
beta phosphate via a ping-pong mechanism, using a phosphorylated
active-site intermediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MANLERTFIAIKPDGVQRGLVGEIIKRFEQKGFRLVAMKFLRASEEHLKQHYIDLKDRPF

- nucleoside triphosphate.
- COPACTOR: Magnesium (By similarity).
- SUBCELLULAR LOCATION: Cytoplasmic and plasma membrane.
- ITSSUB SPECIFICITY: Highest levels in the liver and kidney with lower levels in the heart. brain and breast muscle.
- SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Columba livia (Domestic pigeon).

-!- COFACTOR: Magnesium (By similarity).
-!- SUBDUNIT: Hexamer of two different chains: A and B (A6, A5B, A4B2, A3B3, A2B4, A8B, B6). Interacts with SET (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
-!- DISEABE: This procein is found in reduced amount in tumor cells of high metastasic potential.
-!- SIMILARITY: Belongs to the NDK family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kimura N.;

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP.
-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + nucleoside triphosphate.
-!- COFCTOR: Magnesium (By similarity).
-!- SUBUNIT: Homohexamer.
-!- SUBUNIT: Homohexamer.

It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not ö nucleoside triphosphate.
-!- COFACTOR: Magnesium (By similarity).
-!- TOFACTOR: Magnesium (By similarity).
-!- SUBUNIT: Hexamer of two different chains: A and B (A6, A5B, A4B2, A3B3, A2B4, A8B, B6). Interacts with SET (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear and cytoplasmic.
-!- DISEASE: This protein is found in reduced amount in tumor cells of and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

-!- FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated cotive-site intermediate.
-!- CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP + PROSITE; PS00469; NDP KINASES; 1. ATP-binding; Kinase; Magnesium; Metal-binding; Nuclear protein; 118 118 Pros-phosphohistidine intermediate. 152 AA; 17208 MW; EE2E4DB218024686 CRC64; ö 91.1%; Score 798; DB 1; Length 152; ilarity 100.0%; Pred.     Biol. Chem. 268:2583-2589(1993).
    FUNCTION: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate.
    CATALYTIC ACTIVITY: ATP + nucleoside diphosphate = ADP +

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-FEB-1994 (Rel. 28, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
